DISCIPLINE • STRATEGY • FREEDOM

01 / TRADING INTRODUCTION

Trading is the process of participating in financial markets by taking positions based on an expectation of future price movement. The MUMOFX framework focuses on understanding where price is, where liquidity is likely resting, and how market structure changes before execution.

The objective is not to predict every move. The objective is to build a repeatable process: observe → locate context → wait for confirmation → execute → manage risk → review.

Trading environment

TradingView — charting, analysis and market structure mapping.

TradeLocker / MT5 / MT4 — execution and trade management.

The exact instruments, session times and execution conditions can vary by broker and market. Always verify the live instrument specifications, spreads and trading hours before executing.

MAJOR FOREX PAIRS

- EURUSD
- GBPUSD
- USDJPY
- AUDUSD
- GBPJPY
- USDCHF

02 / TYPES OF TRADERS

STYLE	HOLDING PERIOD	PRIMARY FOCUS
-------	----------------	---------------

Scalper	Seconds to minutes	Short-term price action, liquidity, execution speed
Day Trader	Minutes to hours	Intraday structure, sessions, momentum
Swing Trader	Days to weeks	Higher-timeframe structure and major levels
Position Trader	Weeks to months+	Macro trends and large market cycles

MUMOFX principle: the best trading style is the one that matches your available time, risk tolerance, execution ability and ability to follow a repeatable process.

Financial markets operate through global centers that create changing levels of participation and volatility. Session awareness helps a trader understand when liquidity and momentum are more likely to expand.

Asian session: often develops an early range and important reference levels. In the PAM framework, the Asian middle and low are key reference points.

London session: commonly brings a significant increase in participation and can expand or raid the earlier Asian range before establishing direction.

New York session: can introduce another major liquidity and volatility window, particularly around the overlap with London and important U.S. economic releases.

Session rule: session behavior is contextual—not a guarantee. Volatility, spreads and liquidity can change around news, holidays and unusual market conditions.

04

04 / LIQUIDITY IN TRADING

Liquidity describes the availability of counterparties and executable orders around a market price. In price-action trading, traders often use the term to describe areas where many stop orders, pending orders or other market interest may accumulate.

Why liquidity matters

1. Ease of entry and exit: deeper liquidity generally means more available counterparties, making it easier to transact without dramatically moving price.
2. Lower transaction cost: competitive liquidity can contribute to tighter spreads and lower market-impact costs, although the actual cost depends on the instrument, broker and conditions.
3. Price stability: deeper markets can absorb larger orders more effectively. Thin liquidity can make price move quickly when orders hit the market.

In technical analysis, common liquidity references include equal highs/lows, obvious swing points, session highs/lows and clustered stop locations. A liquidity sweep is a move through such an area followed by a reaction; the sweep alone is not a trade signal.

Important distinction: liquidity is a market property; a chart level is only a hypothesis about where orders may be concentrated. Confirmation still matters.

05

05 / MARKET STRUCTURE

Market structure is the organization of price into swings and directional relationships. Reading structure helps answer a fundamental question: is price continuing, consolidating, or shifting?

Higher High (HH) and Higher Low (HL) commonly describe an advancing structure. Lower High (LH) and Lower Low (LL) commonly describe a declining structure.

Structure break: price violates a meaningful prior swing, suggesting that the existing sequence may be weakening or continuing depending on context.

Market Shift / MSS: a meaningful change in the sequence of swings that can signal a transition from one directional state to another. The quality of the shift depends on location, liquidity, displacement and higher-timeframe context.

Read structure in layers:

Higher timeframe = directional context → session structure = active range → execution timeframe = confirmation and entry.

06

06 / STRATEGY — PAM

The MUMOFX PAM framework combines three ideas into one execution model:

P — PRICE ACTION

Price action is the direct study of how price moves: impulse, pullback, rejection, consolidation, breaks and reactions around important levels. The trader first reads what price is communicating rather than entering simply because a single candle pattern appears.

A — ASIAN MIDDLE & LOW

The Asian session range becomes a reference framework. The Asian low can represent a sell-side liquidity reference, while the Asian middle provides a balance/reference point inside the range. Price interaction with these levels is interpreted together with broader structure and session context.

M — MARKET SHIFT LEVELS

After price reaches an important reference or liquidity area, the trader waits for evidence of a market shift. This can include a sweep, displacement and a break of a meaningful internal swing. The goal is to avoid entering simply because price touched a level.

PAM execution sequence

1. Map structure → 2. Mark Asian middle/low → 3. Identify liquidity → 4. Wait for price action at the level → 5. Look for market shift → 6. Execute with predefined risk → 7.

Manage and review.

07

07 / PAM TRADE BLUEPRINT

A high-quality PAM setup can be thought of as a sequence rather than a single signal.

1. Context: establish higher-timeframe directional structure and important levels.
2. Asian map: mark the Asian high, middle and low. Give special attention to the middle and low in this framework.
3. Liquidity: identify obvious highs/lows where orders may be concentrated.
4. Interaction: wait for price to reach or interact with the planned area.

5. Confirmation: look for a meaningful shift in market structure rather than guessing the reversal.
6. Execution: enter only when the setup satisfies the predefined rules; define stop-loss and position size before entry.
7. Management: manage the position according to the trading plan, not emotion.
8. Review: record the setup, context, entry, risk, outcome and lesson.

Risk first. A strong setup can still lose. The PAM framework is an educational methodology, not a guarantee of profit. Position sizing and maximum loss rules should be defined before execution.

08

08 / CORE TERMINOLOGY

Liquidity — Availability of executable buying and selling interest; in chart analysis, often discussed around areas where orders may cluster.

Market Structure — The sequence and relationship of price swings.

HH / HL — Higher High / Higher Low — common characteristics of bullish structure.

LH / LL — Lower High / Lower Low — common characteristics of bearish structure.

MSS — Market Structure Shift — evidence that the prior swing sequence may be

changing.

Sweep — A move through an obvious liquidity area followed by a reaction; confirmation is still required.

Asian Middle — The midpoint/reference level of the defined Asian trading range.

Asian Low — The lower boundary of the defined Asian trading range.

MUMOFX TRADING

Read the market. Respect liquidity. Wait for the shift. Execute with discipline.

SMC | SMART MONEY CONCEPTS

TRADE WITH THE INSTITUTIONS | FOLLOW THE MONEY

SAME CHART
DIFFERENT EYES
SMC SHOWS YOU
THE REAL STORY

1 MARKET STRUCTURE

Identify the trend and key reversals.

Uptrend

(Higher Highs & Higher Lows)

Downtrend

(Lower Highs & Lower Lows)

2 KEY LEVELS

Mark areas where smart money enters and exits.

3 ORDER BLOCKS

The last opposing candle before a strong move.

Bullish Order Block

Last bearish candle before the rally

Bearish Order Block

Last bullish candle before the drop

4 FAIR VALUE GAPS (FVG)

Imbalance in price where price moves too fast.

Bullish FVG

Gap between candle 1 and 3

Bearish FVG

Gap between candle 1 and 3

FVG Rules:

- ✓ 3-candle pattern
- ✓ Candle 2 leaves a gap
- ✓ Acts as support/resistance (retest area)

5 LIQUIDITY

Where stop losses and pending orders are clustered.

Buy-side Liquidity

(Above highs)

Liquidity Sweep

Sell-side Liquidity

(Below lows)

Liquidity Sweep

6 LIQUIDITY SWEEP & MSS

Sweep liquidity, then look for a Market Structure Shift (MSS).

Liquidity Sweep

MSS

Entry (on retest)

Order Block

7 CHOCH & BOS

Shows the shift in market direction.

CHOCH (Change of Character)

Break of structure

Possible reversal

BOS (Break of Structure)

Break of structure

Trend continuation

8 TRADE SETUP (FULL FLOW)

1

Identify Market Structure (trend)

2

Mark Liquidity Levels (highs/lows)

3

Look for Order Blocks / FVGs (at key levels)

4

Wait for Liquidity Sweep & MSS/CHOCH

5

Execute Trade (on retest / confirmation)

PATIENCE + DISCIPLINE = CONSISTENT RESULTS

LET THE MARKET COME TO YOU.

KEY PRINCIPLES

- ✓ Trade with the trend
- ✓ Follow liquidity
- ✓ Use order blocks & FVGs
- ✓ Wait for confirmation
- ✓ Manage your risk
- ✓ Be patient
- ✓ Keep a trading journal

"The market doesn't move randomly, it moves to fulfill orders."

TRADING

DISCIPLINE | STRATEGY | FREEDOM

RISK MANAGEMENT

1. Risk Tolerance – Is amount of money willing to lose on a trade

- Determined by number of PIPS, position order and stop loss
- Usually 0.5%-3% of total account.
